

Privacy-first invitations for people who host a lot.

You know this app as **Soirée** — the one we ran the band's show on last March. **InviteKit is that same app, generalized.** Same magic-link RSVPs and clean guest experience, now built to run *any* host's events under *any* brand. Soirée was the first night out; this is the product it grew into.

Partiful and Evite are free because *you're* the product — your guest list gets harvested and advertised against. InviteKit is the opposite: clean, no ads, no guest accounts, and **open-source, so we can't sell your data.**

The opportunity isn't one-off party-throwers — they'll use whatever's free and viral. It's **recurring hosts**: bands, clubs, classes, congregations, communities running many events for the same people. They want co-organizers, a guest list that persists across events, and their own branding — a real need the viral apps ignore, and a group that will pay.

WHAT IT DOES TODAY

- **One-tap RSVPs** — guests reply by magic link; no account, no app to download.
- **Guest management** — add by hand or import a CSV, with smart paste of name + email.
- **Email built in** — invites, reminders, nudges, thank-yous, and custom sends.
- **Live headcount** — RSVPs and guest counts update in real time.
- **Comments** — public notes or private messages between guest and host.
- **Your brand** — name and look are configurable; private by design — the invite link is the only key.

The model. The hosted service is the business; the open-source code is the moat — it's what makes “we can't sell your data” believable, and it doubles as marketing. Live today at **free-vite.com**; single-tenant now, multi-tenant white-label next.

WHERE YOU COME IN

This is the part I'd love your head on. The bet is that *recurring* hosts — people like us with the band — are who'd actually pay. Does that ring true? And what would make a host switch from whatever they use now?
